East/West Freight Routes Phase 2 Study

Kent County, Delaware

Executive Summary

This study is a continuation of and builds on the Kent County East-West Truck Freight Route Feasibility Analysis Phase 1 study which was completed in December 2022. This current study, as well as the Phase 1 study, were sponsored by the Kent Economic Partnership (KEP) and managed through the Dover/Kent County MPO (MPO). This initiative supports the mission of the KEP to spur economic development in Central Delaware. A 2018 analysis by Rockport Analytics and Reach Market Planning identified logistics and manufacturing as two of the target industries for Kent County, both of which require a robust and reliable transportation network which led KEP to sponsor the Phase 1 and Phase 2 freight route studies.

This study encompasses the entirety of Kent County, Delaware, an area of 798 square miles. Given the extent of the study area, potential improvements were initially evaluated on a macro level, and then prioritized based on industry support, coordination with local officials, KEP insight, and a prioritization matrix that was created as part of this study.

The purpose of this study was to identify east/west routes or portions of routes in Kent County that present challenges for freight movement and recommend targeted improvements or potential new alignments that would enhance efficiency, reliability, and safety of freight movement across the county.

Based on the results of the prioritization analysis, the following six (6) recommendations were conceptually developed including cost estimates:

SR 1 Interchange – Dover

Design	\$750,000
Row	\$2,300,000
Construction	\$5,908,000
Total	\$8,958,000

Hazlettsville Road to Forrest Avenue Extension – Dover

Design	\$1,600,000
Row	\$2,500,000
Construction	\$9,244,000
Total	\$13,344,000
*Concept 2 Total	\$13,014,000

*Approximately \$330,000 less than Concept 1

East/West Freight Routes Phase 2 Study

Kent County, Delaware

US 113 N to SR 1 S Ramp – Milford

Design	\$397,000
Row	\$750,000
Construction	\$3,004,000
Total	\$4,151,000

Airport Road to Warner Road Connector – Milford

Design	\$746,000
Row	\$1,000,000
Construction	\$5,993,000
Total	\$7,739,000

US 13 Crossover – Harrington

Design	\$93,000
Row	\$0
Construction	\$626,000
*Total	\$719,000

* This improvement was prioritized as part of a separate TIF, therefore funding could potentially be secured from an alternate source other than DelDOT's Capital Transportation Program (CTP).

Main Street Truck Restriction – Clayton

Design	\$485,000
Row	\$200,000
Construction	\$1,932,000
Total	\$2,617,000

East/West Freight Routes Phase 2 Study

Kent County, Delaware

Introduction

The Dover Kent County MPO on behalf of The Kent Economic Partnership (KEP) initiated a study to build on the previous completed East West Freight Routes, Phase 1 study to develop specific improvements and recommendations on how to improve the capacity, reliability, and efficiency of east west freight routes in Kent County.

This initiative supports the mission of the KEP to spur economic development in Central Delaware. The transportation network and access to markets is critical to business attraction and retention efforts of the KEP in central Delaware.

In 2018, Rockport Analytics and Reach Market Planning performed a target cluster analysis of Kent County, seeking a manageable list of viable industry targets for economic development strategy and outreach (*Figure 1*). The study identified logistics and manufacturing as two of the target industries for Kent County. The nature of these industries is the movement of goods throughout the state and region. This requires a robust and reliable transportation network. KEP commissioned an update to the original study in 2020. The results of the study are consistent with the 2018 study. The recommended target areas for Kent County

Figure 1 Rock Analytics and Reach Market Planning

include:

- Business & Legal Services
- Distribution, Warehousing, Logistics
- Health Care
- Fabricated Metals
- Light Manufacturing
- Rental, Leasing, and Repair

Four of the six target areas have critical supply chain requirements and would be supported by improved east west freight access. Additionally, the study identified the key target industries for the three major municipalities in Kent County. These include Smyrna, Dover, and Milford.

This study builds on the efforts of the Phase 1 study. The initial purpose of the Phase 1 study was to determine the most effective east-west freight route for Kent County. As the study progressed it became apparent that it needed to focus on identifying appropriate routes and the possible need for new routes that are designed for truck travel efficiency and reliability. The study analyzed existing east-west truck freight traffic patterns, identified deficiencies that impact freight movements, and provided recommendations for a preferred set of improvements for east west truck freight routes in Kent County. The initial study also explored future infrastructure improvements such as commercial truck bypasses, new bridges, and other improvements, which may be required in the future as Kent County continues to grow.

As identified in the Phase 1 study, Kent County has five major east west corridors that connect the three (3) major municipalities, and other areas of the County to the eastern parts of Maryland, and ultimately the US 50 corridor and Bay Bridge to reach markets in Baltimore and Washington DC, as follows:

East/West Freight Routes Phase 2 Study

Kent County, Delaware

- SR 300 between the Maryland state line and Smyrna
- SR 42 between SR 300 and US 13
- SR 8, SR 11, and SR 44 between the Maryland state line and SR 1
- SR 10 between the Maryland state line and SR 1; also includes the Camden Bypass
- SR 14 between the Maryland state line and SR 1

Based on the initial findings of the Phase 1 study, the Phase 2 Study identified pinch points and other freight movement impediments along the identified routes to determine what specific areas needed a more detailed engineering analysis. These locations became the focus areas of the Phase 2 study.

As part of the Phase 2 study's detailed engineering analysis, scaled conceptual drawings, and alternatives were developed for evaluation. This approach allowed the study to identify and develop detailed alternatives that can be incorporated into the MPO Metropolitan Transportation Plan (MTP) and ultimately the programmed and funded Transportation Improvement Program (TIP).

The Phase 1 plan also recommended an evaluation of a bypass and/or alternate designated truck route. Phase 2 will explore this idea further by looking at possible options in and around the municipal areas. This effort will also need to be coordinated with the MPO's SR42 By-Pass study that will be happening concurrently with this study.

Existing Conditions

Centrally located in the state, Kent County has a total area of 798 square miles and borders New Castle County to the north and Sussex County to the south. It is comprised of eight "Hundreds," a colonial designation with somewhat unclear origins including areas of 100 families or people, or an area that could raise 100 militiamen. There are three cities in the County, Dover, Harrington, and Milford, seventeen Towns, and four unincorporated localities.

Of Delaware's three (3) counties, Kent is the least populated with a population of 181,851 according to the 2020 US Census. According to the 2021 American Community Survey, the racial makeup of that population was as follows: 58.8% Non-Hispanic White, 28.4% Black or African American, 0.8% Native American, 2.4% Asian, 0.1% Pacific Islander, 4.1% multiracial, and 7.8% Hispanic or Latino. The median household income for this population was \$63,715 with 12.2% of the population living below the poverty line.

Major highways located in Kent County include US 13, US 113, as well as thirteen roads that are designated State Routes. The Delmarva Central Railroad operates two freight lines through the County, but there is currently no passenger rail service in the County. Delaware First State operates several local bus routes in Dover, as well as services to other parts of the state including Wilmington, Newark, Georgetown, Lewes, and Rehoboth Beach. Seven public-use and military airports are located in Kent County in Dover, Farmington, Cheswold, Felton, Wyoming, and Smyrna.

East/West Freight Routes Phase 2 Study

Kent County, Delaware

This study encompasses the entirety of Kent County, Delaware (*Figure 2*), and as such required both macro and micro approaches to analyses. As noted previously, this study builds on the Phase 1 Study which was completed in December 2022, and incorporates many of those overall elements, initial findings, and recommendations into this Phase 2 Study. One of the initial steps of the Phase 2 study was to evaluate the recommendations of the Phase 1

Study. This was accomplished through coordination with various municipalities, agencies, and members of the freight community, as well as through in-field analyses. All potential routes recommended in the Phase 1 report were driven, or in the case of new alignment recommendations, evaluated in the field to help determine their viability. Through this evaluation, recommendations from the Phase 1 study were refined, and in some cases, new improvements were identified, evaluated, and recommended. Proposed improvements recommended included upgrades to existing roadways and intersections, development of new alignments, as well as an evaluation of current truck restrictions including potentially adding or lifting existing restrictions.

Several municipalities within the County are home to numerous industries and other organizations that generate significant freight traffic that travel through their towns and other parts of the County. As part of this study, coordination occurred with many of these municipalities and industries to gain their insight into the impact freight movement has on municipalities, and the difficulties freight movers face traveling through them as they seek access to the regional highway network.

Figure 2 Project Location

The primary municipalities, and industries within those municipalities this study focused on include the following:

Clayton:

- Hanover Food Corporation
- Walmart Distribution Center

Dover:

- Delaware Air Force Base
- Central Delaware Aviation Complex
- Garrison Oaks Technology Park
- Kraft Heinz Company
- Proctor & Gamble
- Edgewell Personal Care
- Hirsh Industries

East/West Freight Routes Phase 2 Study

Kent County, Delaware

- Delmarva Corrugated Packaging

Milford

West

- United Cold Storage
- Southern States
- Delaware Building Supply
- Milford Public Works
- Baltimore Air Coil company

East

- Perdue Farms, Inc
- Kent-Sussex Industries, Inc

Harrington

- PJ Woodlands
- OA Newton Company
- Pepsi Bottling Ventures
- Argo LAB
- EZ Work Trucks

Concepts were developed, and recommendations made to facilitate freight movement in these areas and for these industries.

Purpose & Need

The purpose of this study was to identify east/west routes or portions of routes in Kent County, Delaware that present challenges for freight movement. These challenges may include congestion, limited access, roadway geometry, safety concerns, or conflicts with non-freight traffic. The goal is to assess these issues and recommend targeted improvements or potential new alignments that would enhance efficiency, reliability, and safety of freight movement across the county.

The need for this study arises from the growing importance of freight traffic in supporting regional economic development. As freight volumes increase and land patterns evolve, it becomes essential to ensure that Kent County can accommodate these changes while also minimizing negative impacts on communities, infrastructure, and other roadway users. This study supports the efforts to strengthen the county's freight transportation network and position it for changes in the future.

East/West Freight Routes Phase 2 Study

Kent County, Delaware

Industry & Community Outreach

The analyses performed as part of this study were valuable and important components in identifying potential east/west freight route improvements. In addition to these analyses, it was essential to solicit feedback from area freight movers to gain firsthand knowledge of the travel issues and challenges they face in the County, as well as gaining perspective from the communities that freight mover travel though regularly.

As noted previously, the study area encompasses all of Kent County, Delaware. Given the extent of the study area and the type of study, it was not practical, feasible nor would it have been efficient to hold general, public workshops and expect a robust turnout. Instead, the more effective approach was to target key stakeholders, including drivers, dispatchers, and others in the freight community, as well as officials in the towns and cities that are regularly affected by freight movement.

A survey was developed in both hard copy and online formats to solicit input from freight the community. The hard copy was mailed to a project mailing list of known freight generators throughout the County. The hard copy included a QR Code providing the option to complete the Questionnaire electronically. The completed Questionnaires can be found in [Appendix A](#) of this report.

In addition to the Questionnaire, this study included meetings and presentations to various stakeholders, both freight movers, as well as local officials from municipalities affected by freight movement. The following provides a complete list of these meetings to date:

- | | |
|--|--------------------|
| • Development of Freight Generators Survey | February 2024 |
| • Mailing of Survey to Freight Generators | March 2024 |
| • Stakeholder Roundtable | March 26, 2024 |

East/West Freight Routes Phase 2 Study

Kent County, Delaware

Prioritization

Given the number of routes identified and evaluated countywide, it was not practical at this level of study to develop full concept plans for each recommendation. *Figures 3 & 4* highlight these routes, illustrating the extent of analyses performed as part of this study.

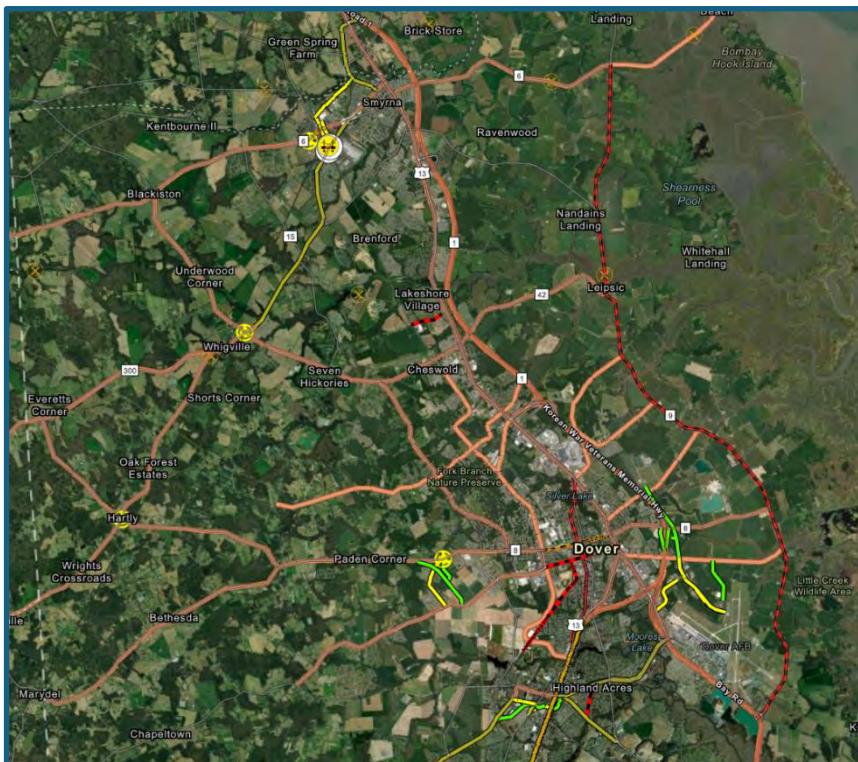

Figure 3 Improvements Evaluated Northern Kent County

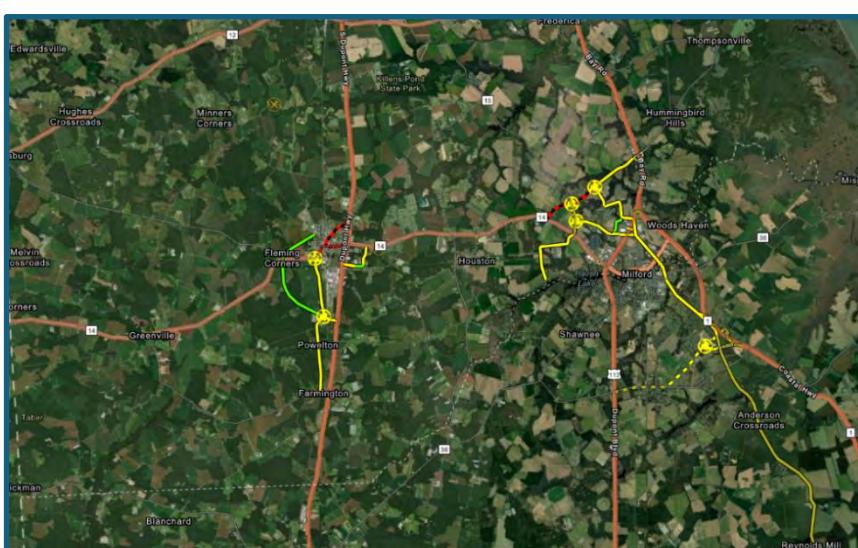

Figure 4 Improvements Evaluated Southern Kent County

Legend

Proposed Lines

- Proposed Truck Connection (Green line)
- Upgrade Existing Roadway (Yellow line)
- Potential Roadway Upgrade (Dashed yellow line)

Truck Restrictions

STATUS

- Existing Truck Restriction (Red line)
- Explore Feasibility of Lifting Truck Restrictions (Green line)
- Explore Feasibility of Adding Truck Restriction (Yellow line)

East/West Freight Routes Phase 2 Study

Kent County, Delaware

To help determine which recommendations should be fully developed, a Prioritization Matrix was created to evaluate several key criteria. These included the number of trucks benefitting, impediments removed, presence of bottlenecks on routes, and support from the Kent Economic Partnership (KEP). *Figure 5* presents the matrix with the full set of criteria used to rank proposed recommendations. *Figure 6* shows the relative score of each recommendation based on those criteria.

Although all the recommended improvements were identified as part of the Phase 2 Study, full concept plans and cost estimates were developed for the top six (6) ranked recommendations countywide.

The methodology used to calculate the “Number of Trucks Benefiting” involved applying each road segment’s Average Annual Daily Traffic (AADT) and its truck percentage based on its Traffic Group Pattern.

E/W Freight Routes Phase 2 Prioritization Matrix				
Criteria	Method of Measurement	Measurment Ranges	Overall Score	
Number of Trucks Benefitting	Number of Trips	801-1000	5	
		601-800	4	
		401-600	3	
		201-400	2	
		0-200	1	
Impediments Removed	Width	1	>4	5
	Weight	3	4	4
	Turning Movements	2	3	3
			2	2
			1	1
Bottlenecks	Is the project located on an identified bottleneck?	Yes	1	
		No	0	
KEP Support	Is the project desired by the local community and the surrounding industries?	Highest Priority	5	
		High Priority	4	
		Medium Priority	3	
		Low Priority	2	
		Lowest Priority	1	
Freight Route	Is the project located on an identified freight route?	Yes	1	
		No	0	

Figure 5 Prioritization Matrix

In addition to the Prioritization Matrix, input from the freight community was an important factor in determining which recommendations moved forward for full concept development. Input included meetings with freight drivers and business owners, local officials, and the Delaware Farm Bureau, the public, as well as the results from the project Questionnaire.

The Kent Economic Partnership’s (KEP) feedback and prioritization of the recommendations

were heavily weighted. As the project sponsor, the KEP plays a vital role in driving countywide economic growth. This includes collaborating with existing industries to identify ways to improve freight movement to and from their businesses and the regional highway network. Also, the KEP works to attract new industries to the county which involves regular correspondence with potential businesses about the transportation improvements that would encourage them to establish operations in the county. Because the KEP’s priorities are informed by direct industry input, they carried significant weight in the final ranking of the recommendations.

East/West Freight Routes Phase 2 Study

Kent County, Delaware

E/W Freight Routes Study, Phase 2 Recommendations	Number of Trucks Benefiting	Impediments Removed	Bottlenecks	KEP Support	Freight Route	Total Score	Final Rating
SR 1 Interchange – Dover	5	2	1	5	1	14	1
Hazlelville Road to Forrest Avenue Extension – Dover	4	3	1	4	0	12	2
US 113 to SR 1 Ramp – Milford	5	2	1	2	1	11	3
Airport Road to Warner Road Extension – Milford	5	3	1	2	0	11	4
US 13 Crossover – Harrington	2	3	0	3	1	9	5
SR 14 and SR 13 Intersection Improvement	5	2	0	1	1	9	6
SR 42/SR 300 Intersection Improvement	5	1	0	1	0	7	7
Main Street Truck Restriction – Clayton	3	1	0	2	0	6	8
SR 8 Truck Restriction	5	0	0	0	0	5	9

Figure 6 Prioritization of Recommendations

Concepts

Based on the results of the prioritization analysis, the following six (6) recommendations were identified for full concept development. These concepts are listed in geographical order, from north to south throughout Kent County, not by their priority ranking.

Clayton

Main Street Truck Restriction

This concept involves rerouting truck traffic from using Main Street through Clayton. Currently, high volumes of trucks, many from Hanover Foods, traveling east on Millington Road continue through Main Street to access regional highways including US 13 and SR 1. Through meetings and follow-up coordination with Clayton town officials, they expressed a desire to eliminate trucks with a regional destination from using Main Street. Based on this coordination, a concept was developed that would post a truck restriction on the Main Street/School Lane intersection and reroute trucks to School Lane to Wheatley's Pond Road (SR 300). This concept would include converting the traditional intersection of Main Street/School Lane to a roundabout to facilitate truck travel. School Lane is currently under evaluation as part of another study, including the intersection of School Lane/Wheatley's Pond Road and conceptually includes: replacing the existing six (6) foot sidewalk on the south side of School Lane with a ten (10) foot shared use path (which would be shifted slightly south to accommodate the proposed roundabout), a new traffic signal including a protected left turn phase from Wheatley's Pond Road to School Lane and pedestrian signals, new right and left turn lanes from Wheatley's Pond Road to School Lane, and new pedestrian crosswalks on School Lane and Wheatley's Pond Road.

East/West Freight Routes Phase 2 Study

Kent County, Delaware

Figure 8 Main Street and School Lane Roundabout, Clayton

East/West Freight Routes Phase 2 Study

Kent County, Delaware

Figure 9 provides the conceptual improvements along School Lane in Clayton.

Figure 9 School Lane Improvements, Clayton

Dover

The City of Dover is vital to the economic base of Kent County, and the efficient movement of freight through the City is important to that base. Several major industries and other large freight generators travel through and are even located in the City. The Dover Air Force Base, Central Delaware Aviation Complex (CDAC), and Garrison Oaks Technology Park are located east of SR 1. Kraft Heinz Company, Proctor & Gamble, Edgewell Personal Care, Hirsh Industries, and Delmarva Corrugated Packaging are located off the POW/MIA Parkway on the western side of the City. These industries, and others in the City, as well as numerous within the region routinely travel through downtown Dover as they seek to access the regional highway network. Numerous studies related to the efficient movement of freight through Dover have been conducted, and these studies were reviewed and utilized to assist in the development of improvements as part of this study. The improvements recommended from these other studies are also imperative to facilitate freight movement in the Dover area. These improvements are in varying stages of completion. Funding sources differ and have been identified for some but not others. Most have been fully vetted, and together with the recommendations from this study form a comprehensive freight network for the City of Dover and the surrounding area. The following describes the conceptual alternatives developed for the City of Dover as part of this study.

East/West Freight Routes Phase 2 Study

Kent County, Delaware

Figure 10 provides locational context and an overview of the proposed SR 1 Interchange improvements.

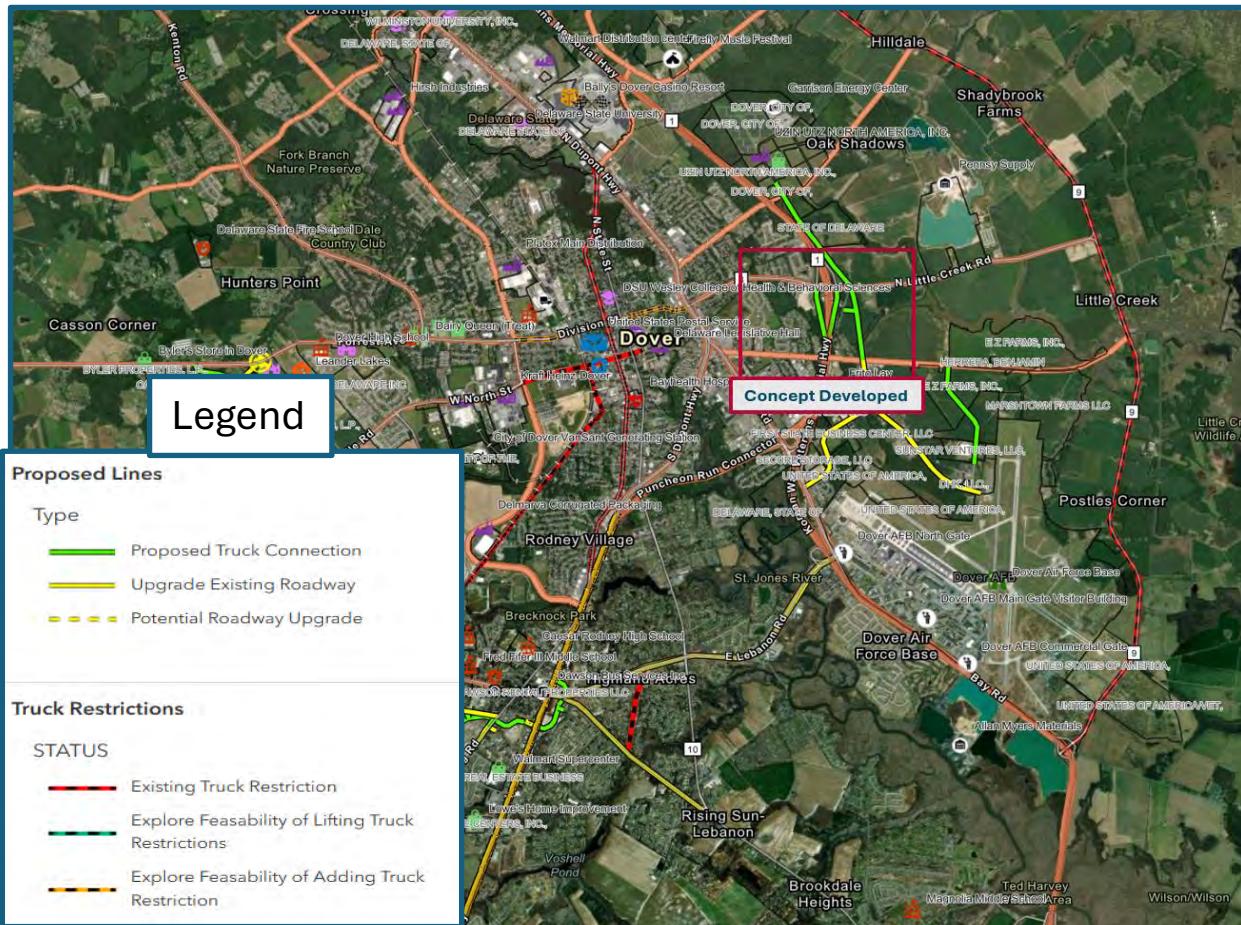

Figure 10 Improvements Overview, Dover East

SR 1 Interchange

The existing SR 1 Interchange at N. Little Creek Road in Dover is a half-diamond configuration, consisting of a northbound on-ramp and a southbound off-ramp. Requests for this interchange to be completed have been common through various past studies, including as part of the Dover Air Cargo Freight Access Study. At the time of that study, the recommendation was to not pursue completing this interchange due to several factors including geometric challenges and costs (the complete study is available on the Dover/Kent County MPO's website). However, since the time of that study, additional industrial development has occurred in this area and requests from the freight community for completing this interchange persist. In addition, the City supports this improvement which was learned through coordination with City of Dover officials as part of this study.

East/West Freight Routes Phase 2 Study

Kent County, Delaware

The proposed improvement would add a northbound off-ramp from SR 1 to N. Little Creek Road and a southbound on-ramp from N. Little Creek Road to SR 1 (*Figure 11*). Both ramps would greatly

Figure 11 SR 1 Interchange

improve access to and from the industrial complexes in this area, including the CDAC and Garrison Oaks Technology Park and would make the area much more attractive for future industries.

Hazletville Road to Forrest Avenue Connector

While the completion of the SR 1 interchange facilitates freight movement on the east side of Dover, improving freight access on the west side was also a focus of this study. Several major industries in this area including Kraft Heinz Company, Proctor & Gamble, and Edgewell Personal Care use the POW-MIA Parkway, Forrest Avenue (SR 8), and Hazlettville Road (SR 15) to and from points west, including the Bay Bridge in Maryland to access Baltimore, MD, Washington DC, and the I 95 corridor. Of particular concern in this area are westbound trucks using Hazlettville Road. Hazlettville Road was not designed to handle high volumes of truck traffic. It is a rural road with narrow travel lanes and shoulders, and much of the road is bound by farmland leading to tractors and other slow moving farm equipment often using the road. To address this, the Hazlettville Road to Forrest Avenue Extension was developed. *Figure 12* provides locational context and an overview of the proposed extension.

East/West Freight Routes Phase 2 Study

Kent County, Delaware

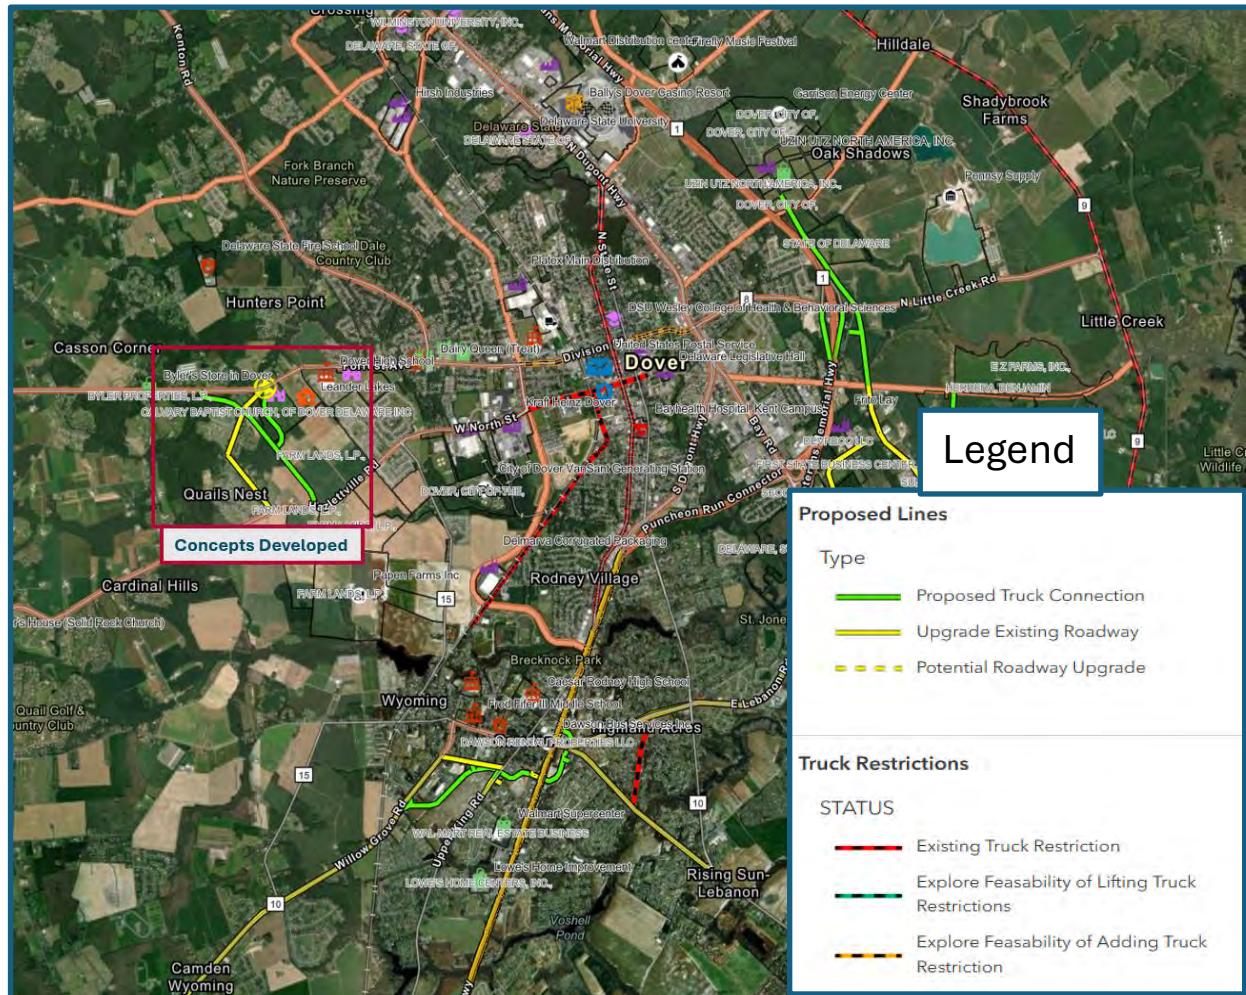

Figure 12 Improvements Overview, Dover West

This concept would include: a connection on new alignment from Hazlettville Road to Forrest Avenue; a new intersection off Hazlettville Road; a new signalized intersection at Forrest Avenue/Artis Drive/Sharon Road; a new intersection with Artis Drive; and two options for new connections from the new alignment to Artis Drive.

Figure 13 shows the entirety of the Hazlettville Road to Forrest Avenue Connector with Connection Concept 1.

East/West Freight Routes Phase 2 Study

Kent County, Delaware

Figure 18 Hazlettville Road & New Connector Intersection

East/West Freight Routes Phase 2 Study

Kent County, Delaware

Division Street (SR 8) Truck Restriction

Another concept that was evaluated to improve freight movement in Dover was exploring the feasibility of adding a truck restriction to Division Street (SR 8) between US 13 and Saulsbury Road (SR 15). The purpose of the study was to investigate the impacts on proposed routes to which trucks would be diverted if a truck restriction was implemented on Division Street in Downtown Dover. This concept would entail restricting all eastbound and westbound trucks, except local delivery trucks, from using Division Street between US 13 and Saulsbury Road. Eastbound and westbound trucks north of SR 8 would be diverted to use the Scarborough/McKee/Saulsbury Road Corridor between US 13 and SR 8 as the proposed North Diverted Truck Route. Eastbound and westbound trucks south of SR 8 would be diverted to use the Saulsbury Road/POW-MIA Parkway Corridor between SR 8 and US 13 as the proposed South Diverted Truck Route.

Figure 19 shows the Division Street (SR 8) Truck Restriction, as well as the North Diverted and South Diverted Truck Routes.

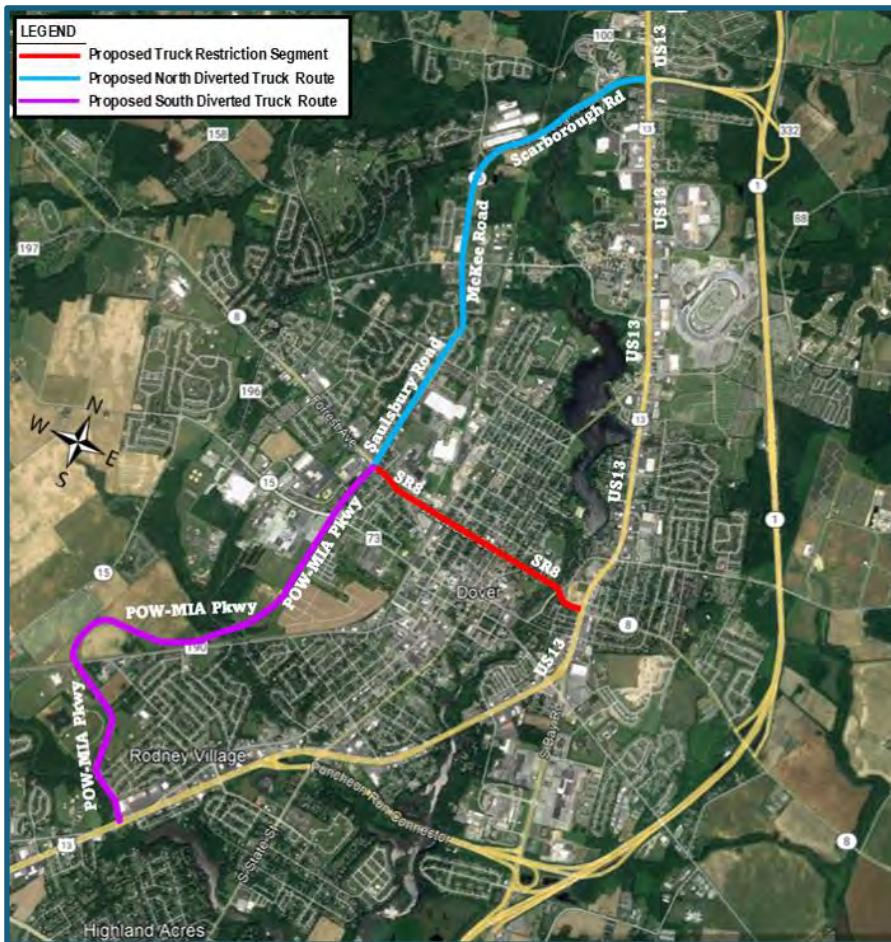

Figure 19 Division Street Truck Restriction & North and South Diverted Truck Routes

East/West Freight Routes Phase 2 Study

Kent County, Delaware

Based on the operational analyses performed for this concept, a comparison between the Future Implementation Year (2025) and the Future Ultimate Year (2052) indicates that there would be no significant increase in delay and no change in level of service (LOS) at the intersections along the North and South Truck Diverted Routes with or without implementation of the Division Street (SR 8) Truck Restriction. It is therefore concluded that the impacted intersections within the study limits would not experience any detrimental decline in traffic operations because of the Division Street (SR 8) Truck Restriction through Downtown Dover.

Based on the travel time assessment performed as part of this study, trucks diverted because of implementing the Division Street (SR 8) Truck Restriction through Downtown Dover would not experience an increase in travel time exceeding two (2) minutes under current A.M. or P.M. peak hour traffic conditions. Assuming traffic increases uniformly throughout West Dover and signal timing adjustments remain consistent, the difference in travel times between the proposed truck-restricted SR 8 segment and the proposed diverted truck routes is not expected to vary significantly from the current difference. It is therefore concluded that diverted trucks within the study limits would not experience an unreasonable increase in travel time because of the Division Street (SR 8) Truck Restriction through Downtown Dover.

However, when presented to the freight community, there were concerns with this concept including travel times (despite the results of the travel time assessment) and fuel consumption. In addition, the Kent Economic Partnership (KEP) did not fully support this recommendation in part due to this lack of industry support. Due to these concerns, additional analyses and further coordination with the freight community are recommended before proceeding forward with this concept. Therefore, additional detailed conceptual development was not conducted for this concept as part of this study.

The complete *Traffic Analysis for SR 8, Downtown Dover Truck Restriction* report can be found in [Appendix B](#) of this report.

Milford

Split by the Mispillion River, the northern portion of the City of Milford is located in Kent County and the southern portion is in Sussex County. This study focused on the Kent County portion of the City, specifically the area west of US 113 in the vicinity of Airport Road and SR 14. There are numerous large freight generators in this area including United Cold Storage, Southern States Corporation, Delaware Building Supply, and Baltimore Air Coil. Access to and from SR 1 is vital to much of this freight traffic. Coordination with the freight industry in this area, as well as City officials, indicated that improved access to and from SR 1 would facilitate freight movement, serve to make this area more attractive for future industrial growth, and avoid having trucks use local roads and portions of the inner-city as they travel to and from the regional highway network.

East/West Freight Routes Phase 2 Study

Kent County, Delaware

Currently, trucks from industries west of US 113 and in the vicinity of Airport Road and SR 14, traveling south on SR 1 exit at the Thompsonville Road interchange and weave their way through a circuitous route of small local roads including Church Hill Road, Bowman Road, and Warner Road, to reach their destinations. To address this, a new connection between Airport Road and Warner Road was developed.

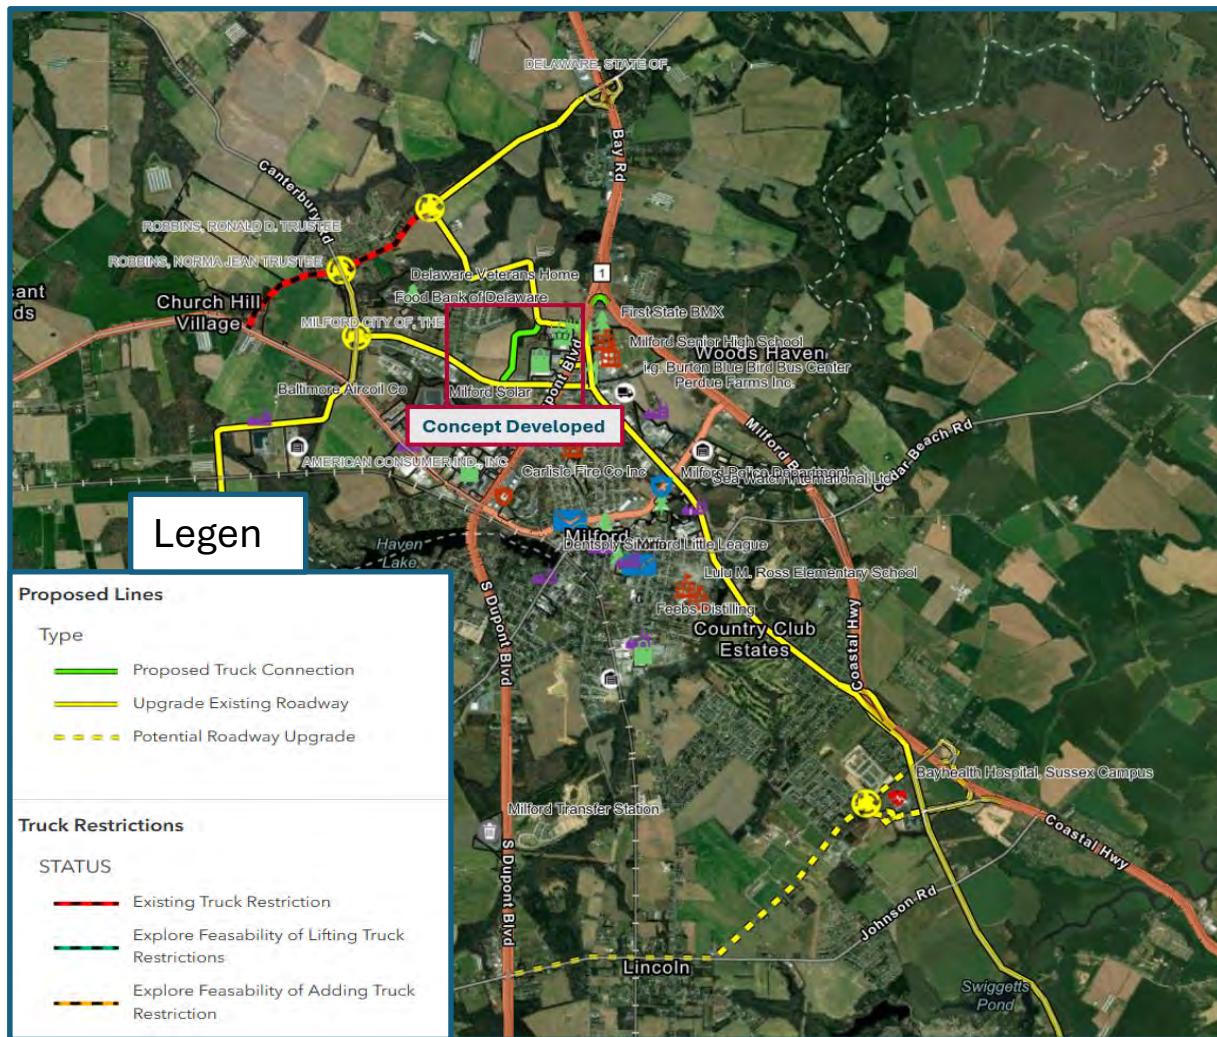

Figure 20 Improvements Overview, Milford West

Figure 20 provides locational context and an overview of the proposed extension.

East/West Freight Routes Phase 2 Study

Kent County, Delaware

Airport Road to Warner Road Connector

This concept would include: a connection on new alignment between Airport Road and Warner Road; improvements to Airport Road including widening and dedicated left and right turning lanes; and new intersections with the proposed extension at Airport Road and Warner Road.

Figure 21 shows the proposed new connector between Airport Road and Warner Road.

Figure 21 Airport Road to Warner Road Connector

Figure 22 shows the proposed Airport Road improvements and the new intersection with the proposed connector.

Figure 22 Airport Road Improvements and Intersection with Connector

East/West Freight Routes Phase 2 Study

Kent County, Delaware

Figure 23 shows the new Warner Road intersection with the proposed connector.

Figure 23 Warner Road Intersection with New Connector

US 113 N to SR 1 S Ramp

Another important link that would facilitate freight movement in Milford, according to City officials, is to provide improved access for trucks traveling north on US 113 to SR 1 south. To address this, a ramp connecting these two important freight corridors was developed. *Figure 24* provides locational context and an overview of the proposed ramp.

East/West Freight Routes Phase 2 Study

Kent County, Delaware

This concept would include a slip ramp for vehicles traveling northbound on US 113 to access SR 1 southbound. [Figure 25](#) shows the proposed US 113 northbound to SR 1 southbound ramp.

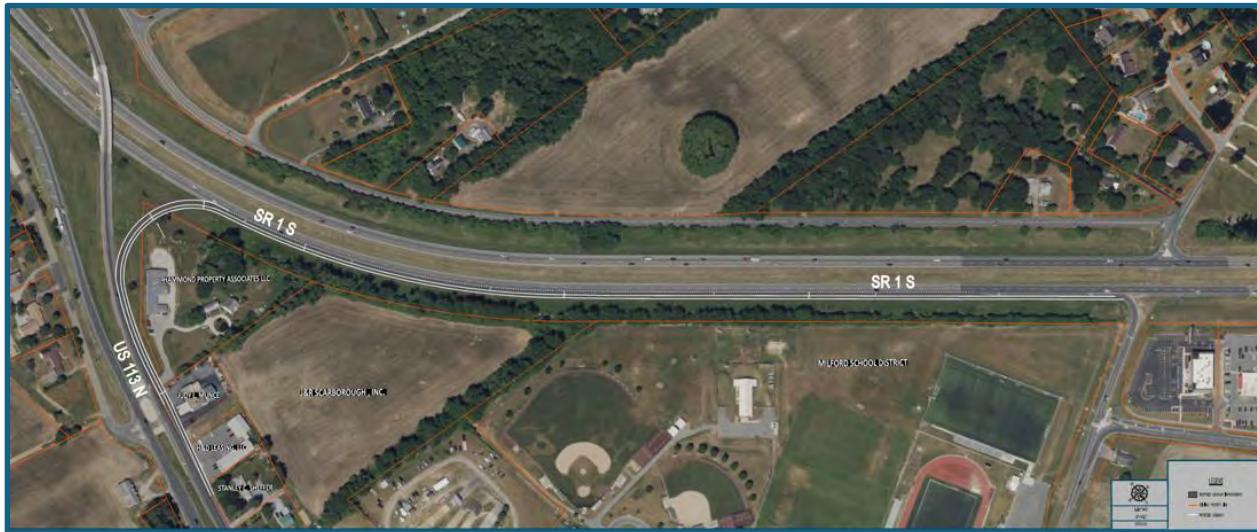

Figure 25 US 113 N to SR 1 S Ramp

Several other improvements in Milford were evaluated such as roadway widenings, intersection upgrades, or the addition of shoulders to the following:

- Church Hill Road improvement between SR 1 and Bowman Road
- Bowman Road improvement between Church Hill Road and Warner Road
- Airport Road improvement between US 113 and Canterbury Road
- NW 10th Street improvement between US 113 and SR 1
- Buccaneer Boulevard improvement between N Walnut Street and entrance to Milford Airpark Plaza
- Holly Hill Rd improvement between SR 14 and Willamsville Road
- N. Walnut Street improvement between US 113 and NW 10th Street
- N Rehoboth Boulevard improvement between NW 10th Street and NE Front Street
- S Rehoboth Boulevard improvements between NE Front Street and SR 1
- Cedar Creek Road improvement between S. Rehoboth Boulevard and Jefferson Road
- Isaacs Road improvement between Jefferson Road and Ellendale Road

While these improvements would benefit freight movement in and around Milford and should be considered through DelDOT's regular program, they are not considered essential at this time and are therefore not recommended for full concept Development as part of this study.

Harrington

Several of the industries east of US 13 in Harrington including Pepsi Bottling, PJ Woodlands, and EZ Work Trucks, experience difficulties attempting to cross US 13 northbound lanes to access US 13

East/West Freight Routes Phase 2 Study

Kent County, Delaware

southbound lanes. To address this issue, a crossover lane was developed between the northbound and southbound lanes of US 13. Although there is an existing crossover lane just north of the proposed new crossover, the existing lane is not geometrically adequate to accommodate the largest trucks. The existing crossover is designed for two lanes to accommodate southbound US 13 traffic to access northbound US 13 and northbound US 13 traffic to access US 13 southbound. However, the geometry of this crossover necessities large turning trucks to encroach on the oncoming lane.

US 13 Crossover

The proposed new crossover is designed for one lane to facilitate northbound US 13 trucks to access US 13 southbound. With this concept, the existing crossover would be converted to a one lane northbound crossover creating two dedicated crossovers for northbound and southbound traffic.

Figure 26 provides locational context and an overview of the proposed US13 crossover in Harrington.

Figure 26 Improvements Overview, Harrington

East/West Freight Routes Phase 2 Study

Kent County, Delaware

This concept includes a single-lane, dedicated crossover for US 13 northbound vehicles to access US 13 southbound. The crossover was designed with adequate width and turning radius to accommodate large trucks. The concept also includes a northbound turn lane to allow vehicles to access the crossover without the need to turn from the travel lane.

Figure 27 shows the proposed US13 crossover in Harrington.

Figure 27 US 13 Crossover

Other improvements in the Harrington area were evaluated that would improve freight movement including:

- Improvements to Kathryn Drive from SR 14 to south portion of JP Latham Inc. north of Conrail tracks
- Extension from Kathryn Drive to Cluckey Drive connecting at OA Newton Company
- Improvements to Cluckey Drive to from OA Newton Company to US 13
- New connection between Park Brown Road/N West Street and Farmington Road with new intersection at Vernon Road
- Improvements from Farmington Road between Vernon Road and Tower Hill Road
- Improvements to Tower Hill Road between Farmington Road and US 13
- Convert intersections to roundabouts at: Commerce Street/Vernon Road; and Farmington Road/Tower Hill Road

These improvements are recommended to be considered through DelDOT's regular program but were found not to be essential as part of this study.

East/West Freight Routes Phase 2 Study

Kent County, Delaware

Individual concept plans for each of the six (6) recommendations identified can be found in [Appendix C](#).

Cost Estimates

Preliminary cost estimates were developed for the six (6) highest-priority projects that received full concept designs as part of this study. These estimates provide a general understanding of the potential funding needs associated with each improvement and include considerations for design, right-of-way, and construction. Prioritization is also necessary and useful from a funding perspective. While DelDOT's Capital Transportation Program (CTP), along with federal matching funds, would support most large capital projects, additional funding sources, such as federal grant opportunities, should also be explored to maximize investment potential and project feasibility.

SR 1 Interchange – Dover

Design	\$750,000
Row	\$2,300,000
Construction	\$5,908,000
Total	\$8,958,000

Hazlettsville Road to Forrest Avenue Extension – Dover

Design	\$1,600,000
Row	\$2,500,000
Construction	\$9,244,000
Total	\$13,344,000
*Concept 2 Total	\$13,014,000

*Approximately \$330,000 less than Concept 1

East/West Freight Routes Phase 2 Study

Kent County, Delaware

US 113 N to SR 1 S Ramp – Milford

Design	\$397,000
Row	\$750,000
Construction	\$3,004,000
Total	\$4,151,000

Airport Road to Warner Road Connector – Milford

Design	\$746,000
Row	\$1,000,000
Construction	\$5,993,000
Total	\$7,739,000

US 13 Crossover – Harrington

Design	\$93,000
Row	\$0
Construction	\$626,000
*Total	\$719,000

* This improvement was prioritized as part of a separate TIF, therefore funding could potentially be secured from an alternate source other than DelDOT's Capital Transportation Program (CTP).

Main Street Truck Restriction – Clayton

Design	\$485,000
Row	\$200,000
Construction	\$1,932,000
Total	\$2,617,000

All costs are based on conceptual designs and are rounded to the nearest thousandth. Details of the cost estimates are provided in [Appendix D](#).

A. EXECUTIVE SUMMARY

This traffic study was conducted to investigate the impacts on proposed routes to which trucks would be diverted if a truck restriction is implemented on SR8 within Downtown Dover. This implementation would be part of the Dover Kent MPO's East/West Freight Routes Study options. All eastbound/westbound trucks, except local delivery trucks, would be restricted from using SR8 between US13 (N Dupont Highway) and SR15 (Saulsbury Road). East/west trucks north of SR8 would be diverted to use Scarborough/McKee/Saulsbury Road Corridor between US13 and SR8 (Proposed North Diverted Truck Route). East/west trucks south of SR8 would be diverted to use S Saulsbury Road/POW-MIA Parkway Corridor between SR8 and US13 (Proposed South Diverted Truck Route). To that end traffic operational analyses were performed for the following intersections within the study limits:

1. US13 (K2) at Scarborough Road (K294)
2. Scarborough Road at S Delaware Tech Drive/Crawford Carroll
3. McKee Road (K156) at Scarborough Road (K294)
4. McKee Road at College Road (K99)
5. McKee Road/Saulsbury Road (K156) at Walker Road (K157/K70)
6. Saulsbury Road at SR8, Forrest Avenue (K51)
7. Saulsbury Road at Gateway Boulevard
8. Saulsbury Road/POW-MIA Parkway (K151) at West North Street/Hazlettsville Road
9. POW/MIA Parkway at Wyoming Mill Spur/Delmarva Corrugated Packaging Entrance
10. POW-MIA Parkway (K151) at Baden Powell Way (K151A)
11. POW-MIA Parkway at US13 (K24)
12. SR8, E Division Street (K16) at US13 (K7)

A travel time assessment was also performed to assess the impact of the SR8 Truck Restriction through Downtown Dover on the trucks rerouted to the Diverted Truck Routes. A summary of the study results and resulting conclusions are as follows:

Traffic Operations

Based on the operational analyses, except for the intersection of SR8 at US13, all the other study intersections would operate at LOS D or better for existing and all future traffic conditions with all the proposed and committed developments. The intersection of SR8 at US13 would operate at LOS E with 78.8 seconds delay and LOS E with 76.3 seconds delay for the P.M. peak hour respectively for FIY 2025 without the SR8 Truck Restriction and FIY 2052 with the SR8 Truck Restriction. It is expected that since the intersection is within DelDOT's coordinated signal system, the unsatisfactory LOS would be addressed as part of the wider DelDOT US13 Coordinated Signal Corridor Improvements.

Comparison of FIY 2025 and FIY 2052 with and without the SR8 Truck Restriction implementation indicate that there is no significant increase in delay and no change in LOS at the intersections along the North and South Truck Diverted Routes. For FIY 2025, the worst increase in delay would be 1.6 seconds and would be experienced during the P.M. peak hour at the intersection of POW / MIA at US13. For FIY 2052, the worst increase in delay would be 3.1 seconds and would be experienced during the A.M. peak hour at the intersection of McKee Road at Scarborough Road.

Similarly, improvements at the east and west limits intersections of the SR8 Truck Restriction segment from which trucks are diverted are also not significant. For FIY 2025 the best improvement would be a 2.3

second delay reduction experienced during the A.M. peak hour at the intersection of SR8 at US13. For FUY 2025 the best improvement, a 2.5 second delay reduction, would again be experienced at the intersection of SR8 at US13, but during the A.M. peak hour.

It is therefore concluded that based on results of the operational analyses, the *impacted intersections within the study limits would not experience any detrimental decline in traffic operations as a result of the SR8 Truck Restriction through Downtown Dover.*

Travel Time

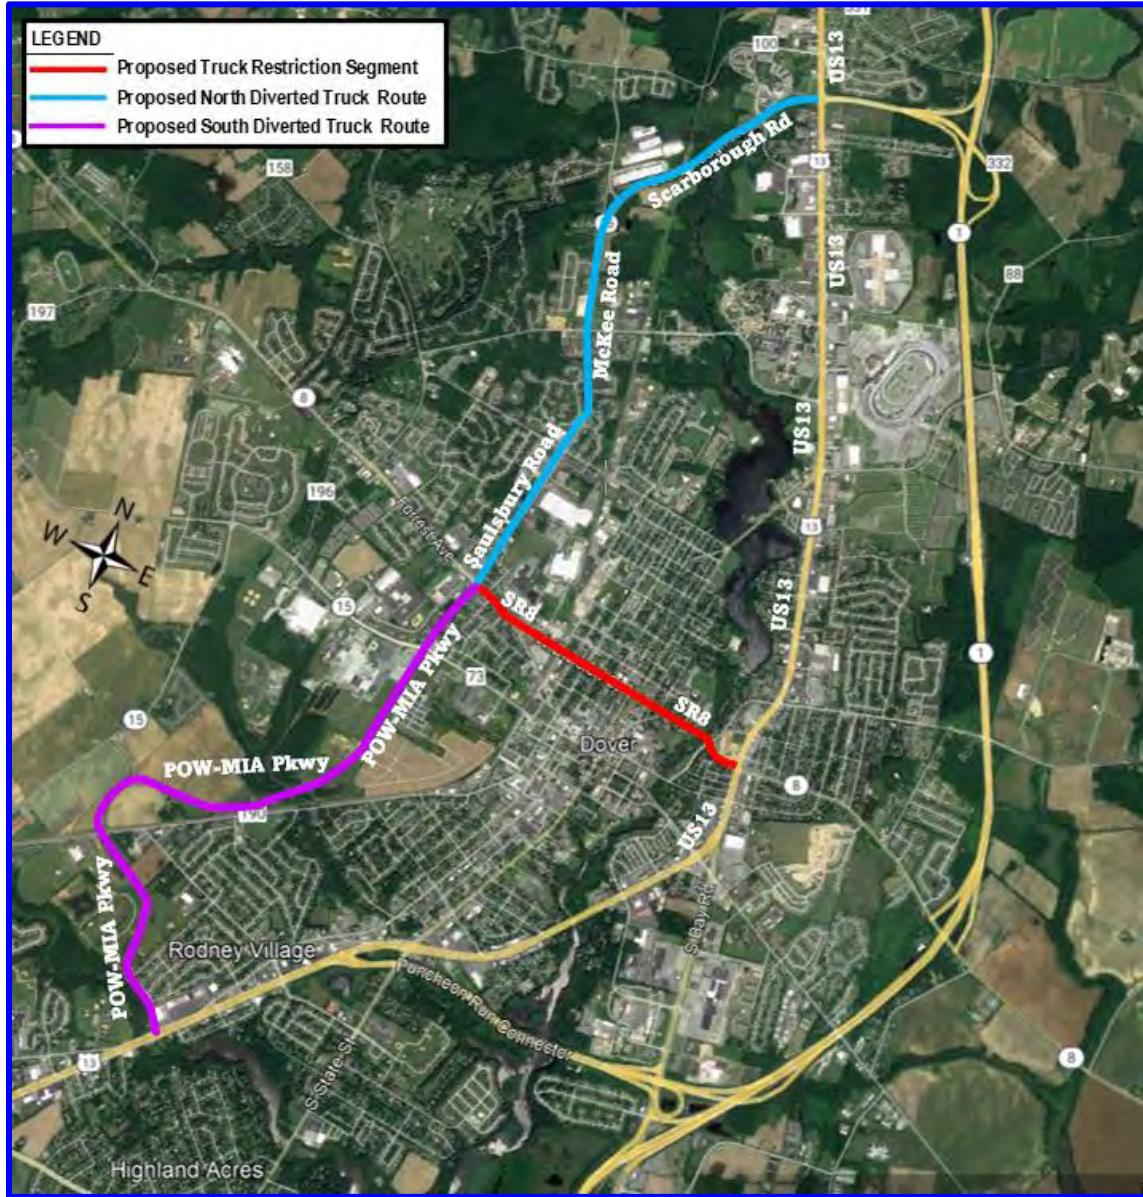

Based on the travel time assessment performed as part of this study, trucks diverted as a result of implementing the SR8 Truck Restriction through Downtown Dover would not experience an increase in travel time exceeding two (2) minutes under current A.M. or P.M. peak hour traffic conditions. Only westbound trucks that would have to divert to the North Diverted Truck Route would experience the highest additional travel time for the A.M. peak hour traffic conditions. Assuming that traffic increases fairly uniformly throughout West Dover as confirmed by the growth rate provided for by DelDOT Planning for the McKee Road Corridor Study, and which was used to generate future traffic for this study, it is logical to assume that with things like signal timing adjustments being equal, the *difference* in travel times between the proposed Truck Restricted SR8 segment, and the proposed Diverted Truck Routes, should not vary significantly from the current difference.

It is therefore concluded that based on results of the travel time assessment, *diverted trucks within the study limits would not experience unreasonable increase in travel time as a result of the SR8 Truck Restriction through Downtown Dover.*

B. INTRODUCTION

This traffic study investigates the impacts on proposed routes to which trucks would be diverted if a truck restriction is implementing on SR8 within Downtown Dover. This implementation would be part of the Dover Kent MPO's East/West Freight Routes Study options. **Figure 1** presents the traffic study area. As shown in the figure, all eastbound/westbound trucks, except local delivery trucks, would be restricted from using SR8 between US13 (N Dupont Highway) and SR15 (Saulsbury Road). East/west trucks north of SR8 would be diverted to use Scarborough/McKee/Saulsbury Road Corridor between US13 and SR8 (Proposed North Diverted Truck Route). East/west trucks south of SR8 would be diverted to use S Saulsbury Road/POW-MIA Parkway Corridor between SR8 and US13 (Proposed South Diverted Truck Route). Since the truck restriction option is very low cost, it was imperative to conduct a very cost-effective study.

Figure 1: Traffic Study Area

C. TRAFFIC

1. Existing Traffic Conditions

A.M. and P.M. peak hour turning movement counts were obtained for the two critical signalized intersections between which the truck restriction is proposed, the intersection of SR8 at Saulsbury Road and the intersection of SR8 at US13 respectively on Wednesday May 29, 2024, and Thursday May 30, 2024. These were regular weekdays when the local school systems were in session. The raw counts are included in **Appendix A**.

Existing traffic data also obtained on regular weekdays when the local school systems were in session between Tuesday, April 12, 2022, through Thursday April 14, 2022, were utilized for the remaining signalized intersections analyzed in this study. The 2022 counts were adjusted as necessary based on the same traffic growth rate trend of 0.75% per annum in the West Dover area that DelDOT Planning provided for the Dover/Kent MPO's McKee Road Corridor Study completed in 2022, and the 2024 turning movement counts for the two key intersections previously mentioned. In all, twelve intersections, eleven of which are signalized are expected to be impacted by the proposed truck restriction and associated truck diverted routes. The signalized intersections are as listed below:

13. US13 (K2) at Scarborough Road (K294)
14. Scarborough Road at S Delaware Tech Drive/Crawford Carroll
- 15.** McKee Road (K156) at Scarborough Road (K294)
16. McKee Road at College Road (K99)
17. McKee Road/Saulsbury Road (K156) at Walker Road (K157/K70)
18. Saulsbury Road at SR8, Forrest Avenue (K51)
19. Saulsbury Road at Gateway Boulevard
20. Saulsbury Road/POW-MIA Parkway (K151) at West North Street/Hazletville Road
21. POW-MIA Parkway (K151) at Baden Powell Way (K151A)
22. POW-MIA Parkway at US13 (K24)
23. SR8, E Division Street (K16) at US13 (K7)

The twelfth intersection is the currently unsignalized intersection of POW-MIA Parkway at Wyoming Mill Spur. The A.M. 2024 turning movement traffic volumes for all vehicles and for trucks posted on diagrams of the road network are provided respectively in **Figure 2** and **Figure 3**. The P.M. 2024 turning movement traffic volumes for all vehicles and for trucks, posted on diagrams of the road network are provided respectively in **Figure 4** and **Figure 5**.

2. Future Traffic Conditions

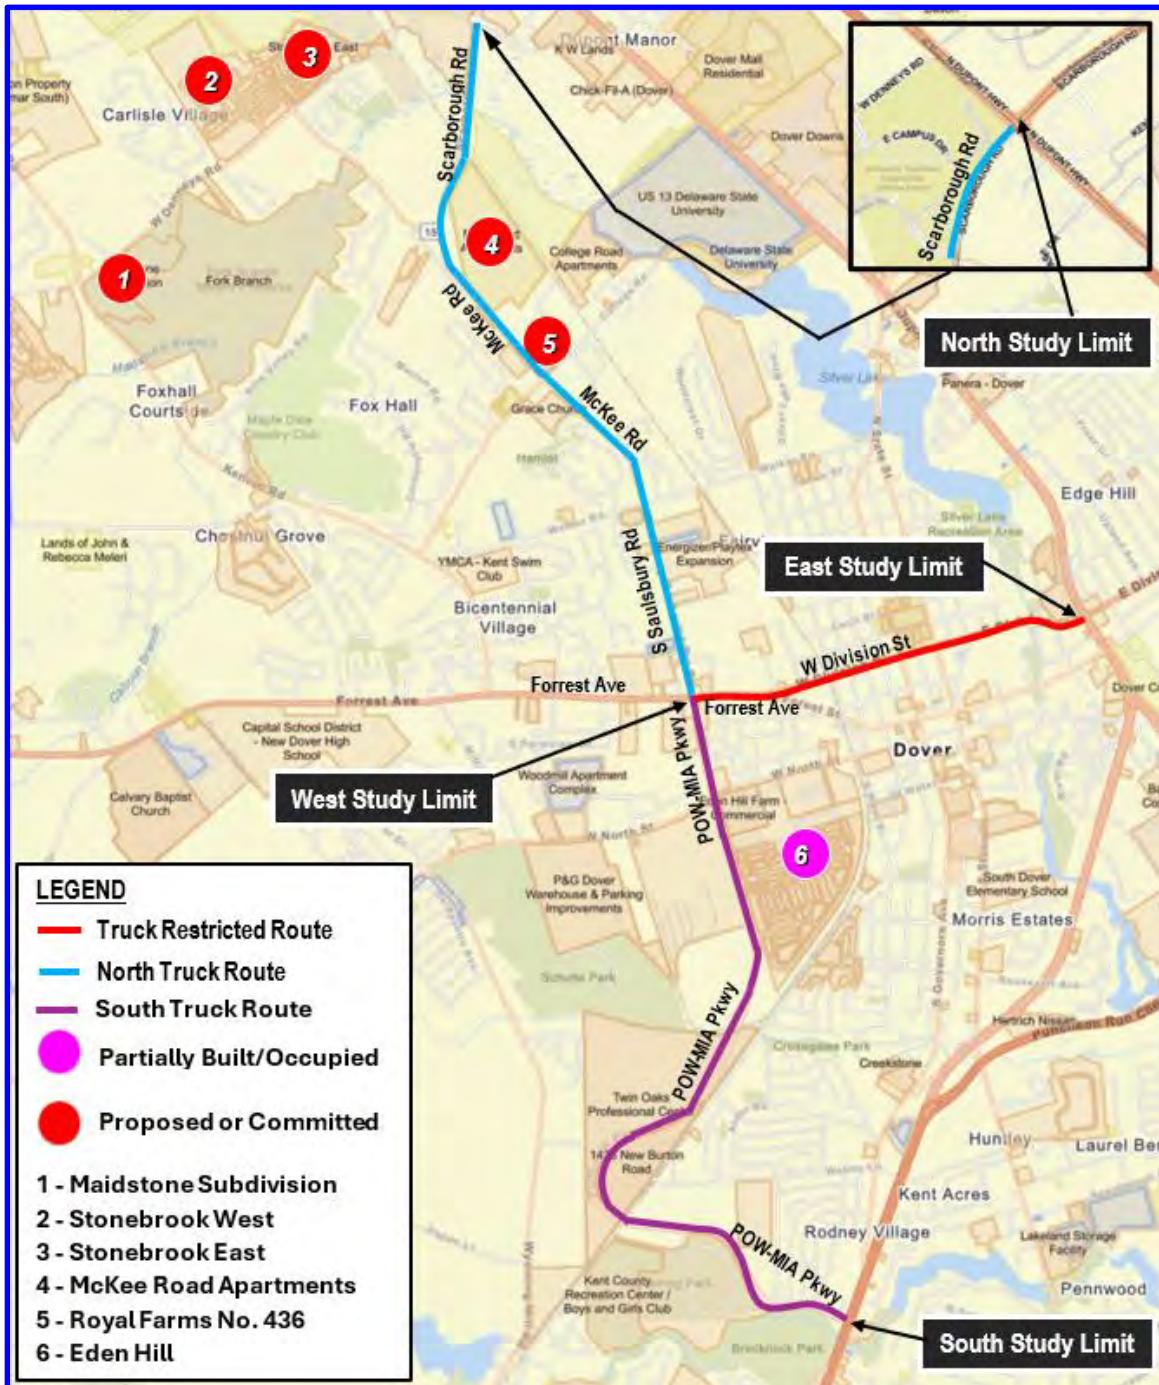

It is expected that if adopted, the truck restriction would be implemented in 2025. The aforementioned Dover/Kent MPO's McKee Road Corridor Study, which included most of the current study area intersections, utilized design year 2052. Future traffic for this study was therefore developed for future implementation year (FIY) 2025 and future ultimate year (FUY) 2052. Future traffic volumes with background growth only were developed based on the growth rate of 0.75% per annum provided by DelDOT Planning Section discussed previously. In addition to the expected general background growth in traffic, proposed and committed developments' traffic expected to utilize the study area road network were also included in the future 2052 traffic volumes. Traffic volumes from these developments were added on to the background growth for the future year 2052 to obtain the final FUY 2052 traffic used in the analysis.

Figure 6 shows the location of the proposed/committed developments included the study in relation to the study limits. For the partially completed development of Eden Hill, only traffic from the unbuilt portion of the development was added on. The trip generation tables for Eden Hill are included in **Appendix B** and

Traffic Analysis for SR8, Downtown Dover Truck Restriction East/West Freight Routes Study

the trip assignment traffic volumes for all the committed developments posted on diagrams of the road network are included in **Appendix C**. The trip assignments for the 100% unbuilt developments were obtained from their respective Traffic Impact Studies (TIS).

Figure 6: Proposed/Committed Developments

Future scenarios for which traffic volumes for all vehicles, and traffic volumes for trucks were developed for the traffic analyses are as follows:

1. FIY 2025 without proposed truck restriction
2. FIY 2025 with proposed truck restriction
3. FUY 2052 without truck restriction
4. FUY 2052 with truck restriction.

The A.M. peak hour FIY 2025 without Truck Restriction turning movement traffic volumes for all vehicles and for trucks are respectively presented in **Figure 7** and **Figure 8**. **Figure 9** and **Figure 10** respectively present the P.M. peak hour FIY 2025 without Truck Restriction turning movement traffic volumes for all vehicles and for trucks.

It is logical that if the worst-case scenario analyzed under truck restriction conditions results in acceptable/minimal impact to traffic operations, then, any other scenario will be acceptable as well. Based on this premise assumptions were made that would result in the highest volume of diverted trucks onto the proposed truck diversion routes during the A.M. and P.M. peak hours. This enabled the traffic analysis study to be performed cost-effectively due to the elimination of an otherwise needed costly origin-destination study.

To develop the truck restricted scenario traffic volumes, it was assumed that:

1. All westbound SR8 through traffic at the intersection of SR8 and Saulsbury Road originated from the intersection of SR8 and US13 and would have to be diverted with no reduction for mid-block local delivery trucks.
2. All eastbound SR8 truck traffic at the intersection of SR8 and US13 originated from eastbound SR8 through traffic at the intersection of SR8 and Saulsbury Road and would have to be diverted without any reduction for mid-block local delivery trucks.

The A.M. peak hour FIY 2025 with Truck Restriction turning movement traffic volumes for all vehicles and for trucks are respectively presented in **Figure 11** and **Figure 12**. **Figure 13** and **Figure 14** respectively present the P.M. peak hour FIY 2025 with Truck Restriction turning movement traffic volumes for all vehicles and for trucks.

The A.M. peak hour FUY 2052 without Truck Restriction turning movement traffic volumes for all vehicles and for trucks are respectively presented in **Figure 15** and **Figure 16**. **Figure 17** and **Figure 18** respectively present the P.M. peak hour FUY 2052 without Truck Restriction turning movement traffic volumes for all vehicles and for trucks.

The A.M. peak hour FUY 2052 with Truck Restriction turning movement traffic volumes for all vehicles and for trucks are respectively presented in **Figure 19** and **Figure 20**. **Figure 21** and **Figure 22** respectively present the P.M. peak hour FUY 2052 with Truck Restriction turning movement traffic volumes for all vehicles and for trucks.

D. TRAFFIC ANALYSIS

1. Intersection Operational Analysis

A.M. and P.M. peak hour intersection operational analyses were performed for all the study area intersections under existing and future conditions using the traffic volumes presented in the preceding figures. The scenarios that were analyzed are as follows:

1. Existing Year 2024
2. FIY 2025 without proposed truck restriction
3. FIY 2025 with proposed truck restriction
4. FUY 2052 without truck restriction
5. FUY 2052 with truck restriction.

The operational analyses were performed with Synchro/SimTraffic 11 software. Existing signal timing, coordination, and time of day (TOD) data was obtained from the DelDOT Traffic Management Center (TMC) for use in the analysis to obtain as close to actual operating conditions as possible. The following recommended capacity improvements, identical to those in the Dover/Kent County MPO's McKee Road Corridor Study were implemented in the FUY 2052 traffic operational analyses:

1. One exclusive westbound right-turn lane on College Road with a tentative 175-foot storage, excluding taper
2. One additional northbound through lane along the proposed North Diverted Truck Route (refer to Figure 1) commencing from/tying into the two-lane end point of the currently completed DelDOT *HEP KC, SR8 and SR15 Intersection Improvements* on Saulsbury Road north of the intersection with SR8, and extending to the intersection of McKee Road and Gemstone Drive south of the intersection of McKee Road at Saulsbury Road
3. One additional southbound through lane along the proposed North Diverted Truck Route (refer to Figure 1) within the same limits identified in item number 2 above.
4. Associated signal timing adjustments as a result of the added capacity.

Additionally, DelDOT project HEP KC, US13, Lochmeath Way to Puncheon Run Connector (PRC) will provide a third lane in each direction of US13 from Lochmeath Way to the PRC. The project will therefore add capacity with associated signal timing upgrades at the study intersection of POW-MIA at US13, the southern limits of the study area. Per the DelDOT Projects website, the project construction start date is yet to be determined as of the date of this report. The third lane in each direction of US13 at the intersection is therefore only accounted for in the future ultimate year 2052 scenario but not in the future implementation year 2025 scenario for the truck restriction. This improvement was also accounted for in the MPO's McKee Corridor Study.

The final improvement implemented in the FUY 2052 scenarios that was not included in the Dover/Kent County MPO's McKee Road Corridor Study is the signalization of the intersection of POW/MIA at Wyoming Mill Spur/Delmarva Corrugated Packaging Entrance. The operational analyses output reports generated from Synchro are included in **Appendix D**.

2. Intersection Operational Analysis Results

Measures of effectiveness (MOE) results generated from the synchro traffic operational analyses are delay in seconds per vehicle and level of service (LOS). The LOS criteria are provided in **Table 1**.

The A.M. and P.M. peak hour MOE for 2024, FIY 2025 and FUY 2052 are presented in **Table 2** through **Table 6**. As shown in the tables except for the intersection of SR8 at US13, all the other study intersections would operate at LOS D or better for existing and all future traffic conditions with all the proposed and committed developments. The intersection of SR8 at US13 would operate at LOS E with 78.8 seconds delay and LOS E with 76.3 seconds delay for the P.M. peak hour respectively for FUY 2052 without the SR8 Truck Restriction and FUY 2052 with the SR8 Truck Restriction. It is expected that since the intersection is within DelDOT's coordinated signal system, the unsatisfactory LOS would be addressed as part of the wider DelDOT US13 Coordinated Signal Corridor Improvements.

Table 4 and **Table 6** respectively facilitate the comparison of FIY 2025 and FUY 2052 with and without the SR8 Truck Restriction implementation. The results indicate that there is no significant increase in delay and no change in LOS at the intersections along the North and South Truck Diverted Routes. For FIY 2025, the worst increase in delay would be 1.6 seconds and would be experienced during the P.M. peak hour at the intersection of POW / MIA at US13. For FUY 2052, the worst increase in delay would be 3.1 seconds and would be experienced during the A.M. peak hour at the intersection of McKee Road at Scarborough Road.

Similarly, improvements at the east and west limits intersections of the SR8 Truck Restriction segment from which trucks are diverted are also not significant. For FIY 2025 the best improvement would be a 2.3 second delay reduction experienced during the A.M. peak hour at the intersection of SR8 at US13. For FUY 2025 the best improvement, a 2.5 second delay reduction, would again be experienced at the intersection of SR8 at US13, but during the A.M. peak hour.

Table 1: Level of Service Criteria

LOS	Delay (Seconds per Vehicle)	
	Signalized	Unsignalized
A	0 to 10	0 to 10
B	>10 to 20	>10 to 15
C	>20 to 35	>15 to 25
D	>35 to 55	>25 to 35
E	>55 to 80	>35 to 50
F	>80 and/or V/C >1	>50 and/or V/C >1

E. TRAVEL TIME ASSESSMENT

Eight signalized intersections exist between the east and west limit intersections of the proposed SR 8 Truck Restriction segment through Downtown Dover for which no recent turning movement traffic counts exist. To enable the generation of sound travel time for the segment from the Synchro analysis models used in the analyses for the study, A.M. and P.M. turning movement traffic counts would have had to be obtained for each of those eight intersections.

DelDOT maintains a system of Bluetooth devices at some of the signalized intersections within the study limits from which travel time between the devices are generated. To facilitate a cost-effective study, travel time data from applicable Bluetooth devices was obtained for use from DelDOT to eliminate the need for the additional traffic data collection. A.M. and P.M. peak hour travel times for the proposed truck restricted SR8 segment were derived from Bluetooth devices located at the intersections of SR 8 with US 13, N / S State Street and Saulsbury Road. For the proposed North Diverted Truck Route, A.M. and P.M. peak hour travel times were derived from Bluetooth devices located at the intersections of SR 8 and Saulsbury Road, and at the intersection of Scarborough Road and US 13. A.M. and P.M. peak hour travel times for the South Diverted Truck Route were derived from Bluetooth devices located at the intersections of SR 8 at Saulsbury Road, and at the intersection of POW / MIA Parkway and US 13.

Table 7 and **Table 8** present the travel time comparison for trucks traveling the current SR 8 truck route through Downtown Dover, and the travel times along the associated applicable diverted truck routes. As shown in the tables the highest increase in travel time of 1.98 minutes, would be experienced by westbound trucks that would have to divert to the North Diverted Truck Route under A.M. peak hour traffic conditions.

Table 7: A.M. Peak Hour Travel Time Comparison

SR8 at US13 Turning Movement	Without SR8 Truck Restriction		With SR8 Truck Restriction		Travel Time Difference (Proposed - Original)

Westbound Through			Southbound North Route	7.04	1.37
Southbound Right			Southbound North Route	7.04	1.37

F. CONCLUSIONS

Traffic Operations

Based on the operational analyses, except for the intersection of SR8 at US13, all the other study intersections would operate at LOS D or better for existing and all future traffic conditions with all the proposed and committed developments. The intersection of SR 8 at US13 would operate at LOS E with 78.8 seconds delay and LOS E with 76.3 seconds delay for the P.M. peak hour respectively for FIY 2025 without the SR 8 Truck Restriction and FUY 2052 with the Truck Restriction. It is expected that since the intersection is within DelDOT's coordinated signal system, the unsatisfactory LOS would be addressed as part of the wider DelDOT US13 Coordinated Signal Corridor Improvements.

Comparison of FIY 2025 and FUY 2052 with and without the SR8 Truck Restriction implementation indicate that there is no significant increase in delay and no change in LOS at the intersections along the North and South Truck Diverted Routes. For FIY 2025, the worst increase in delay would be 1.6 seconds and would be experienced during the P.M. peak hour at the intersection of POW / MIA at US13. For FUY 2052, the worst increase in delay would be 3.1 seconds and would be experienced during the A.M. peak hour at the intersection of McKee Road at Scarborough Road.

Similarly, improvements at the east and west limits intersections of the SR8 Truck Restriction segment from which trucks are diverted are also not significant. For FIY 2025 the best improvement would be a 2.3 second delay reduction experienced during the A.M. peak hour at the intersection of SR8 at US13. For FUY 2025 the best improvement, a 2.5 second delay reduction, would again be experienced at the intersection of SR8 at US13, but during the A.M. peak hour.

It is therefore concluded that based on results of the operational analyses, the ***impacted intersections within the study limits would not experience any detrimental decline in traffic operations as a result of the SR8 Truck Restriction through Downtown Dover.***

Travel Time

Based on the travel time assessment performed as part of this study, trucks diverted as a result of implementing the SR8 Truck Restriction through Downtown Dover would not experience an increase in travel time exceeding two (2) minutes under current A.M. or P.M. peak hour traffic conditions. Only trucks westbound trucks that would have to divert to the North Diverted Truck Route would experience the highest additional travel time for the A.M. peak hour traffic conditions. Assuming that traffic increases fairly uniformly throughout West Dover as confirmed by the growth rate provided for by DelDOT Planning for the McKee Road Corridor Study, and which was used to generate future traffic for this study, it is logical to assume that with things like signal timing adjustments being equal, the ***difference*** in travel times between the proposed Truck Restricted SR8 segment, and the proposed Diverted Truck Routes, should not vary significantly from the current difference.

It is therefore concluded that based on results of the travel time assessment, ***diverted trucks within the study limits would not experience unreasonable increase in travel time as a result of the SR8 Truck Restriction through Downtown Dover.***

Intersection Summary

Area Type: Other

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 110 (73%), Referenced to phase 6:SET, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.78

Intersection Signal Delay: 39.0

Intersection LOS: D

Intersection Capacity Utilization 75.3%

ICU Level of Service D

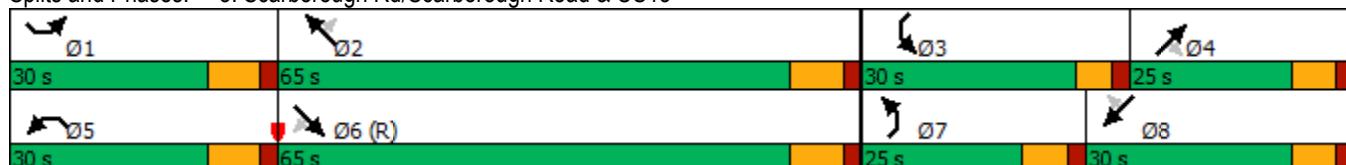

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 8: Scarborough Rd/Scarborough Road & US13

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 91 (76%), Referenced to phase 2:NBT and 6:SBT, Start of Green

Natural Cycle: 110

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.92

Intersection Signal Delay: 35.4

Intersection LOS: D

Intersection Capacity Utilization 66.4%

ICU Level of Service C

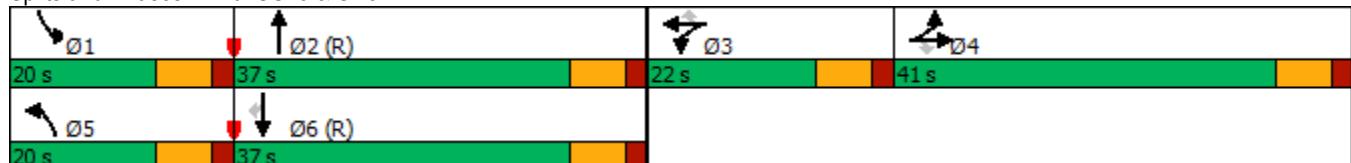

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 0 (0%), Referenced to phase 6:WBTL, Start of Green, Master Intersection

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.78

Intersection Signal Delay: 34.8

Intersection LOS: C

Intersection Capacity Utilization 77.9%

ICU Level of Service D

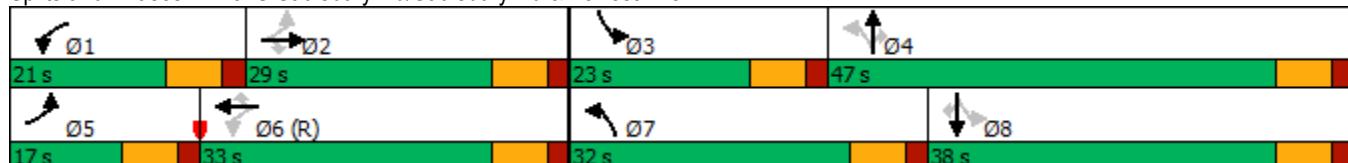

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 25: S Saulsbury Rd/Saulsbury Rd & Forrest Ave

Intersection Summary

Area Type: Other

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 124 (83%), Referenced to phase 2:NBT and 6:SBT, Start of Green

Natural Cycle: 140

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.36

Intersection Signal Delay: 48.4

Intersection LOS: D

Intersection Capacity Utilization 93.0%

ICU Level of Service F

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 62: US13 & POW MIA Pkwy

Lanes, Volumes, Timings

8: Scarborough Rd/Scarborough Road & US13

2025 AM without SR8 Truck Restriction

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 91 (76%), Referenced to phase 2:NBT and 6:SBT, Start of Green

Natural Cycle: 110

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.93

Intersection Signal Delay: 35.0

Intersection LOS: D

Intersection Capacity Utilization 66.4%

ICU Level of Service C

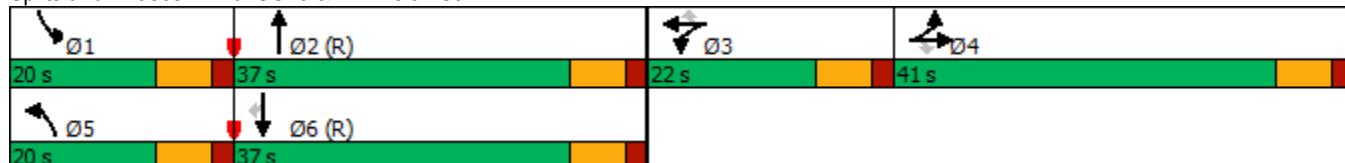

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 20: US13 & E Division St

Lanes, Volumes, Timings

22: McKee Rd/Scarborough Rd & McKee Road

2025 AM without SR8 Truck Restriction

Intersection Summary

Area Type: Other

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 94 (63%), Referenced to phase 6:SBT, Start of Green

Natural Cycle: 60

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.90

Intersection Signal Delay: 24.6

Intersection LOS: C

Intersection Capacity Utilization 61.8%

ICU Level of Service B

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 62: US13 & POW MIA Pkwy

Lanes, Volumes, Timings

8: Scarborough Rd/Scarborough Road & US13

2025 PM without SR8 Truck Restriction

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 0 (0%), Referenced to phase 6:WBTL, Start of Green, Master Intersection

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.79

Intersection Signal Delay: 35.0

Intersection LOS: C

Intersection Capacity Utilization 78.2%

ICU Level of Service D

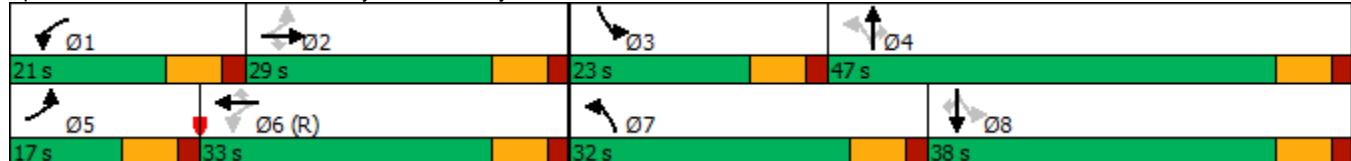

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 91 (76%), Referenced to phase 2:NBT and 6:SBT, Start of Green

Natural Cycle: 120

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.14

Intersection Signal Delay: 41.9

Intersection LOS: D

Intersection Capacity Utilization 74.5%

ICU Level of Service D

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

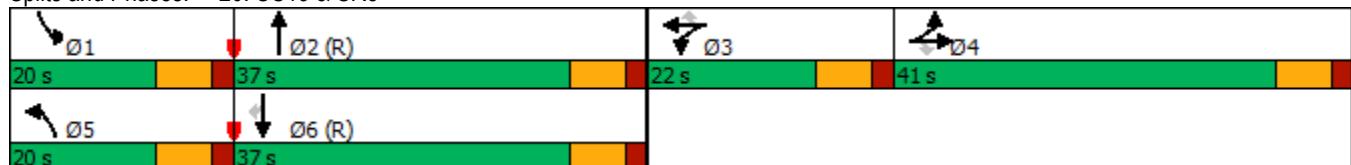

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 20: US13 & SR8

Lanes, Volumes, Timings

2052 AM without SR8 Truck Restriction-Added Lanes

22: McKee Rd/Scarborough Rd & McKee Road

Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 79.2

Natural Cycle: 90

Control Type: Semi Act-Uncoord

Maximum v/c Ratio: 0.89

Intersection Signal Delay: 29.5

Intersection LOS: C

Intersection Capacity Utilization 66.5%

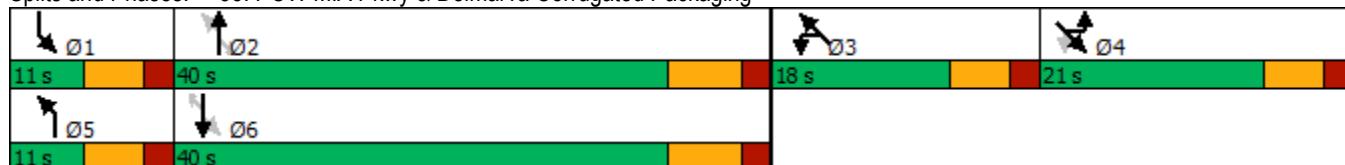

ICU Level of Service C

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

Area Type: Other

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 147 (98%), Referenced to phase 2:NWT and 6:SET, Start of Green

Natural Cycle: 140

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.06

Intersection Signal Delay: 54.2

Intersection LOS: D

Intersection Capacity Utilization 97.4%

ICU Level of Service F

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

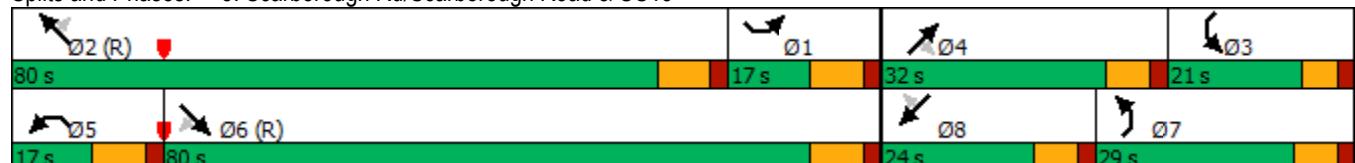

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 8: Scarborough Rd/Scarborough Road & US13

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 89 (74%), Referenced to phase 2:NBT, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.94

Intersection Signal Delay: 28.3

Intersection LOS: C

Intersection Capacity Utilization 93.9%

ICU Level of Service F

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 22: McKee Rd/Scarborough Rd & McKee Road

Lanes, Volumes, Timings

2052 PM with SR8 Truck Restriction-Added Lanes

23: Scarborough Rd & S Delaware Tech Dr/Crawford Carroll Ave

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 0 (0%), Referenced to phase 6:WBTL, Start of Green, Master Intersection

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.02

Intersection Signal Delay: 50.2

Intersection LOS: D

Intersection Capacity Utilization 95.3%

ICU Level of Service F

Analysis Period (min) 15

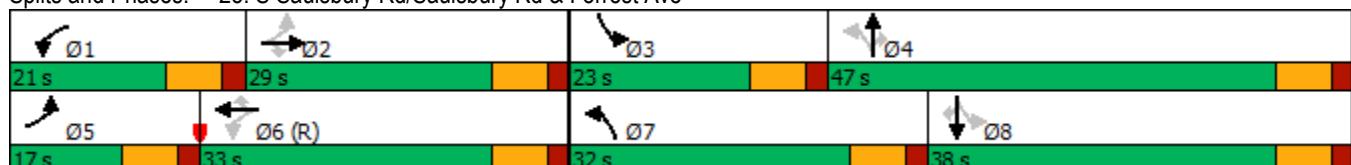

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 82.4

Natural Cycle: 90

Control Type: Semi Act-Uncoord

Maximum v/c Ratio: 1.02

Intersection Signal Delay: 43.6

Intersection LOS: D

Intersection Capacity Utilization 76.8%

ICU Level of Service D

Analysis Period (min) 15

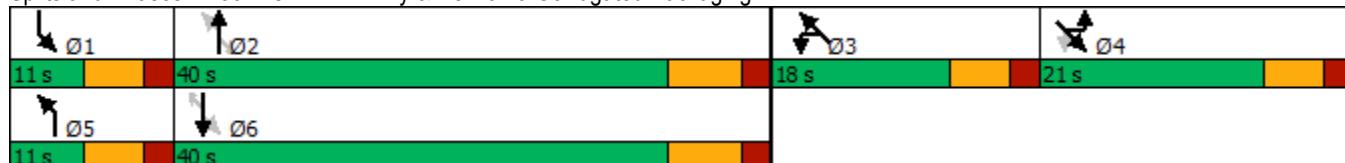

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.
